Project Design Phase-II

Solution Requirements (Functional & Non-functional)

Date	24 October 2026
Team ID	
Project Name	Incident Lifecycle Automation in ServiceNow
Maximum Marks	4 Marks

Functional Requirements

The functional requirements cover the incident lifecycle in ServiceNow, from creating an incident to creating a knowledge article from the resolved incident.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	**Incident Record Creation**	• Create a new incident in Service Operations Workspace • Capture the short description and the caller • Set the assignment group to Service Desk and save the incident
FR-2	**Incident Classification**	• Record the description and the channel • Select the category, subcategory and urgency • Select the service, service offering and configuration item • Add a work note and assign the incident to the agent
FR-3	**Knowledge Integration (Agent Assist)**	• Show knowledge articles based on the short description • Mark an article as helpful • Attach the article with a comment and show it in the activity log
FR-4	**Reassignment & Escalation**	• Add members to the Watch list and the Work notes list • Reassign the incident to the Network support group and clear Assigned to • Let the Level 2 technician assign the incident and update the configuration item • Put the incident On Hold with the reason Awaiting Change
FR-5	**Emergency Change Request**	• Create an emergency change request from the incident • Show the change request in the related records of the incident
FR-6	**Child Incident Creation**	• Create a child incident from the Related Records tab • List the child incident on the parent incident

FR-7	**Incident Resolution**	• Record the probable cause • Record the resolution code and resolution notes • Resolve the incident after confirmation, with the child incident also resolved
FR No.	**Functional Requirement (Epic)**	**Sub Requirement (Story / Sub-Task)**
FR-8	**Knowledge Creation**	• Create a knowledge article from the resolved incident • Use the IT knowledge base and the Standard template • Show the article in the related records of the parent incident
FR-9	**SLA & Related Record Tracking**	• Show Task SLAs in the Related Records section of the incident • Show child incidents, change request and knowledge article in related records
FR-10	**Service Setup & Access**	• Create the service Remote Access and the service offering Corporate VPN as Operational • Control access by roles, and test users through impersonation (Service Desk and Level 2)

NFR No.	Non-Functional Requirement	Description
NFR-1	**Usability**	The incident form is clear, with labelled fields, so an agent can create and classify an incident in a few steps. Screens for incident, change and knowledge records use consistent terms.
NFR-2	**Security**	Users sign in through ServiceNow authentication. Roles decide who can see and change incidents, for example Service Desk agents and Level 2 technicians, and incident data is protected on the platform.
NFR-3	**Reliability**	Incident details, work notes, cause and resolution are saved consistently and are not lost when the incident moves between states or teams.
NFR-4	**Performance**	Incident forms, lists, Agent Assist suggestions and related lists respond quickly under normal use.
NFR-5	**Availability**	The solution is available to the Service Desk and the Network group through the ServiceNow cloud instance and depends on the availability of that platform.
NFR-6	**Scalability**	The solution can handle more incidents, users and support groups, and new categories, groups, services and SLA definitions can be added without rebuilding it.
NFR-7	**Maintainability**	Services, offerings, assignment groups, knowledge bases and SLA definitions are configured on the platform, so administrators can change them without redesigning the solution.

NFR-8	**Auditability**	Changes to an incident, such as assignment, state, work notes and resolution, are recorded with the time and the user, so the history of each incident can be reviewed.

Non-functional Requirements

The non-functional requirements describe the qualities the solution must have.
