Project Design Phase-II
Solution Requirements (Functional & Non-functional)

Date	21 October 2026
Team ID	
Project Name	Incident Lifecycle Automation in ServiceNow
Maximum Marks	4 Marks

Functional Requirements:

Following are the functional requirements of the proposed solution. They cover the incident lifecycle in ServiceNow from recording an incident to closing it.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	**Incident Recording**	Report an incident through the ServiceNow form or portal Capture the caller, short description and detailed description Generate an incident number and confirm it to the caller
FR-2	**Incident Classification**	Select the category and subcategory Set impact and urgency so the priority is calculated Select the affected service and configuration item (CI)
FR-3	**Assignment and Ownership**	Assign the incident to the correct support group Assign the incident to an individual technician Reassign the incident with a note when routed incorrectly
FR-4	**Investigation and Knowledge Reuse**	Search knowledge articles from the incident Attach a knowledge article to the incident Add work notes and comments to record troubleshooting
FR-5	**Related Records**	Link related incidents to a parent incident Create or link a change request when a change is needed Show related records on the incident form
FR-6	**SLA Tracking**	Show SLA status and timers on the incident Show SLA information on related tasks Alert users when an SLA is close to breaching
FR-7	**Resolution and Closure**	Record the cause and workaround Enter resolution notes before resolving the incident Close the incident and notify the caller
FR-8	**Notifications and Reporting**	Notify the caller when the incident state changes Notify the support group when an incident is assigned Report incidents by category, priority and state
FR-9	**Access and Configuration**	Configure categories, assignment groups and SLA definitions Manage user roles and access to incident records

Non-functional Requirements:

Following are the non-functional requirements of the proposed solution.

NFR No.	Non-Functional Requirement	Description
NFR-1	**Usability**	The incident form is simple, with clear field labels, so an agent can record and classify an incident in a few steps. Layout and terms are consistent across incident, task and knowledge screens.
NFR-2	**Security**	Access is controlled by user roles so that users see and change only the records they are allowed to. Users sign in through ServiceNow authentication, and incident data is protected on the platform.
NFR-3	**Reliability**	Incident records, work notes and resolution details are saved consistently and are not lost between states. Mandatory fields prevent incomplete records from moving forward.
NFR-4	**Performance**	Incident forms, lists and searches respond quickly under normal use, and rules and notifications run without noticeable delay for the agent.
NFR-5	**Availability**	The solution is available to the service desk and support groups during working hours through the ServiceNow instance, and depends on the availability of the platform.
NFR-6	**Scalability**	The solution can handle growing numbers of incidents, users and support groups, and new categories, groups and SLA definitions can be added without rebuilding it.
NFR-7	**Maintainability**	Categories, assignment groups, SLA definitions and notifications are configured on the platform, so administrators can change them without redesigning the solution.
NFR-8	**Auditability**	Changes to an incident, such as assignment, state and notes, are recorded with the time and the user, so the history of each incident can be reviewed.
